

Ideation Phase
Brainstorm & Idea Prioritization Template

Date	31 july 2026
Name	Mallampati Bharadwaj
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Analyze the current manual network request process and identify existing challenges.
Review the Service Catalog variables (device_type, connection_type, address, and user_name) along with the workflow requirements.
Identify the keystakeholders involved, including the Requester, System Administrator, and IT Network Team.
Prioritize solutions that reduce provisioning time, eliminate manual logging errors, and enhance the overall user experience.

NETWORK REQUEST AUTOMATION BRAINSTORM Let's collaborate to automate the manual network resource request process in ServiceNow using Flow Designer. Our goal is to reduce provisioning cycles from days to minutes and eliminate manual logging errors. SESSION OVERVIEW <table><tr><td>Time to Prepare</td><td>10 minutes</td></tr><tr><td>Time to Collaborate</td><td>1 Hour</td></tr><tr><td>Recommended Team Size</td><td>2 – 8 People</td></tr></table> FOCUS OF THIS SESSION - User Catalog Submission - Administrative Approvals - Automated Record Insertion - Stakeholder Notifications - Reduce Cycle Time & Errors	Time to Prepare	10 minutes	Time to Collaborate	1 Hour	Recommended Team Size	2 – 8 People	BEFORE YOU COLLABORATE A little preparation goes a long way. Here's what you need to do to get going. 10 MINUTES 1 Understand the Current Process Review the existing manual network request process and identify pain points. 2 Review Key Components - Catalog Variables: device_type, connection_type, address, user_name - Flow Logic: Catalog Submission → Approvals → Insert into u_network_database → Notifications 3 Identify Stakeholders Users, System Administrator, Network Team, IT Operations 4 Come with Ideas Think of ways to automate, simplify, and improve the process. OUR GOAL Automate network resource requests in ServiceNow so provisioning cycles drop from days to minutes while eliminating manual logging errors.	DEFINE YOUR PROBLEM STATEMENT What problem are we trying to solve? Frame it as a How Might We (HMW) statement for our brainstorm. 5 MINUTES OUR PROBLEM (HMW) How might we seamlessly bridge the communication gap between a user's catalog submission, administrative approvals, and final data table inserts so that network provisioning cycles drop from days to minutes while eliminating manual logging errors? GROUND RULES - Stay in topic. - Defer judgment. - Go for volume. - Encourage wild ideas. - Listen to others. - If possible, be visual.
Time to Prepare	10 minutes							
Time to Collaborate	1 Hour							
Recommended Team Size	2 – 8 People							

Step-2: Brainstorm, Idea Listing and Grouping

Step 3: Idea Prioritization

Evaluated all brainstormed ideas based on Importance (Operational Impact) and Feasibility (Technical Ease of Implementation).

Identified standardized catalog choice fields, Flow Designer approval workflow, automatic record insertion, and email notifications as high-priority features due to their high business value and ease of implementation.

Considered infrastructure compliance logging, dynamic approval routing, and automatic incident creation as future enhancements because they require additional customization and scripting.

Categorized portal progress tracking and enhanced email templates as secondary improvements that enhance user experience without affecting the core workflow.

Assigned multi-level approval workflows and automatic timeout-based rejection a lower implementation priority because they add complexity and are not essential for the initial deployment.

Focused the implementation roadmap on delivering the core automation workflow first, while reserving advanced features for future project phases.
